

1st Anniversary of Amateur Timewave Recording

Eckhard Kantz, DL9GMU
f.e.r.a.c.

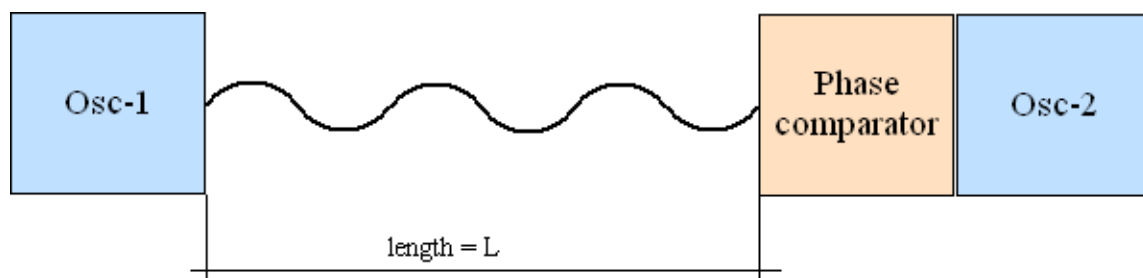

The system which will be described in the following has been designed for detecting tiny changes in the Earth's gravitational field. In particular it aims at detecting travelling spacetime curvatures. The working principle is based on General Relativity which relates gravity changes to changes of timeflow. A well known experiment that confirmed the mentioned relationship between gravity and time, which had been predicted by Albert Einstein in his General Relativity Theory, was performed by Hafele and Keating in October 1971, see the related reports in the Internet.

The idea

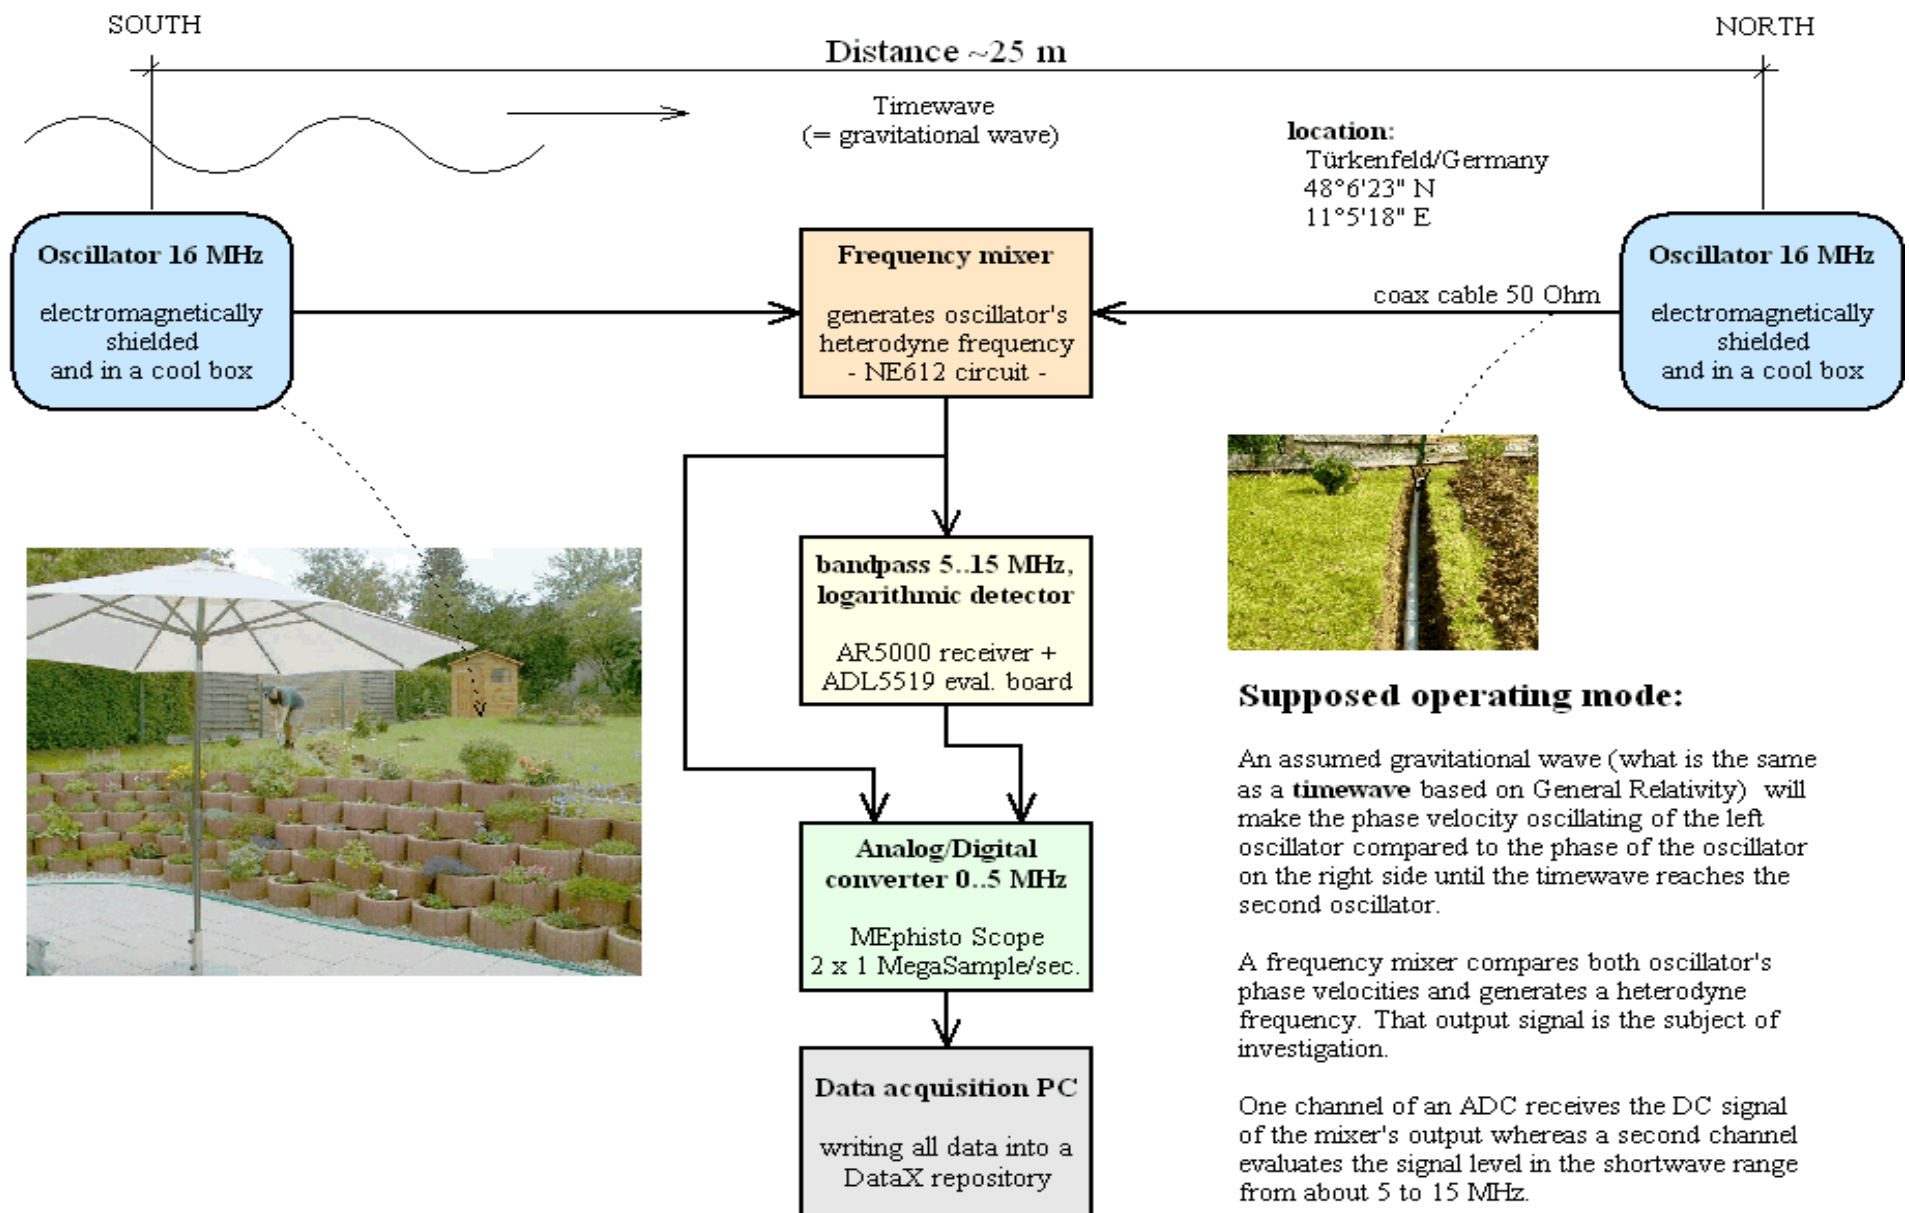

During discussions in the European Radio Astronomy Club (ERAC) about requirements for reference clocks in "Very Large Baseline Interferometry (VLBI)" systems it became obvious, that even the most accurate H₂ maser clocks will fail if gravity changes in one of the locations of a VLBI system, e.g. due to movements in the Earth crust. In this case a change of gravity will be equivalent to a change of timeflow in that location which in turn will have impact on the reference clock's phase difference compared to other locations, independently how stable and how precise that reference clock might be in standalone operation.

Explanation trial

The following description is my individual trial to explain the signals that could be expected on the system's output. This explanation may be incomplete or even completely wrong due to my limited theoretical knowledge. More profound explanations are welcome at any time and they can be sent to ERAC's mailing list: <mailto:discussion@eracnet.org>.

In my view there is a temporary unbalanced situation in a RF cable that connects Osc-1 in the above image with the phase comparator in the moment when gravity does change by a tiny increment. In this moment the time frame of the whole system will also change by a tiny increment in timeflow which in turn changes the wavelength in this local system. When the wavelength changes the electrical length of the cable will also change (different number of cycles inside L). The unbalanced situation will continue until the oscillations from before the gravity change will have left the cable. Since this takes place already in the new timeframe, the phase velocity of those "stored" Osc-1 cycles will be different and those differences can be detected by comparing Osc-1 phase against Osc-2 phase. That's all from my point of view what happens in the system when it is hit by a gravity change.

Relation to Earth-based science

The disclosure project (see <http://www.disclosureproject.org>) informed in spring 2001 about new technologies that have been developed in so called “black covered projects” during last decades and that are hidden from public till today. Those technologies include space energy access (free energy) systems, anti-gravitational propulsion systems as well as quantum technology that allows for tapping on spacetime dynamics for wheather engineering, for triggering earthquakes and for making impact on peoples’ conscious mind and health in areas that get exposed to beams of that usually invisibly propagating quantum vacuum state pattern.

The amateur timewave recording aims at getting parts of the scientific results from those black covered projects into a public area. The main procedure for getting an idea of the scientific work in the covered projects is mental resonance. This is a method that is available to everyone, however it is not well recognized until now. The method is based on exploiting information in morphogenetic fields which have been build up over time and that contain all information that the scientists in those projects have been and are dealing with. A person being interested in the information can ask questions and she and he will receive answers in a mental way that may convey ideas, images and even numerical information.

That “intuitive knowledge acquisition” seems to belong to basic instruments that every human being is equipped with from the very beginning of life. Often it is not well acknowledged or even ignored. Furthermore the coupling to freely accessible thought fields can be extremely reduced after food intake for multiple hours, when drinking alcohol upto one day and after sex upto multiple days. Thus someone seeking for thought field experience is well adviced eating moderate meals, maybe to fast from time to time, not to drink alcohol and to abstain from sex for a longer time. The resulting spiritual experience will be overwhelming and it will reward the effort in multiple ways. Besides a better health the physical ability for healing smaller problems yourselves by the power of thoughts will be activated additionally, also known as the legendary "healing with your hands". It will be easier to activate that physical ability which is available to everybody, for those people who were born next to a "New Moon" inside one of the years with high solar activity inside the 11-years solar cycle. Those people can also help others very efficiently. Besides all those opportunities the acquisition of new knowledge from thought fields is from my point of view the greatest source that one can get connected to.

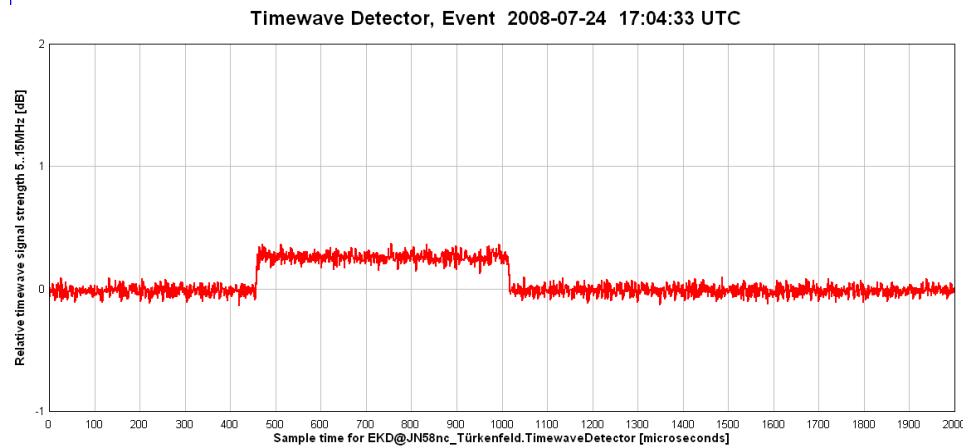

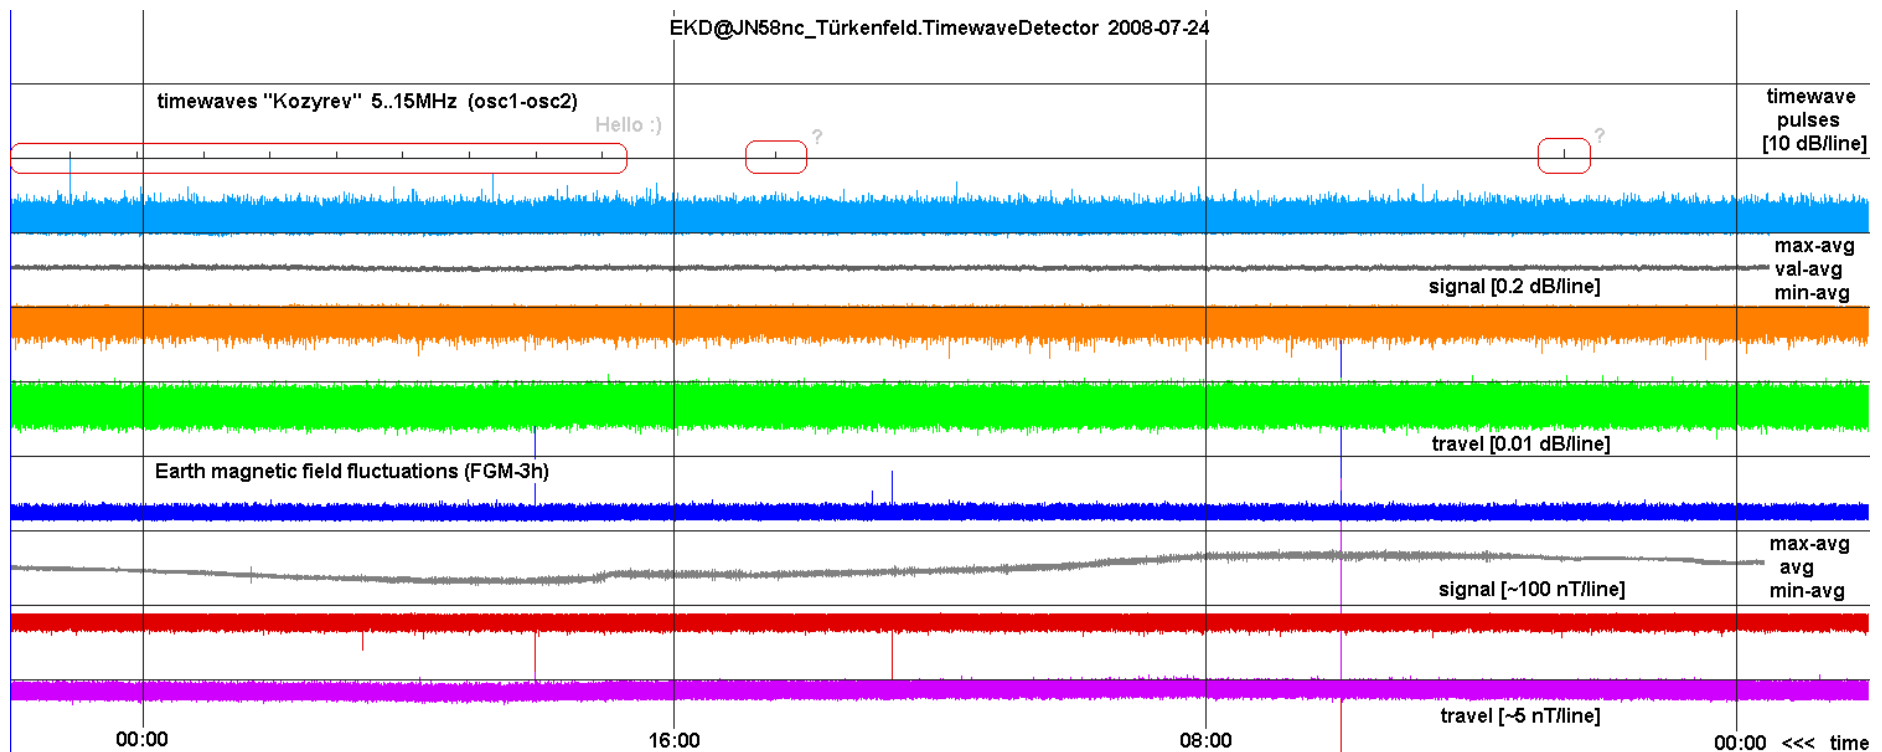

In the following some exceptional signals will be presented from the first year of amateur timewave recording which may become a starting point for in-depth research in the months and years to come. The complete set of daily timewave charts is available at:

<http://wegalink.eu/research>

and interested scientists can get all data they want out of the repository (about 4.3 Gbytes a month = 1 DVD). I would like to thank those scientists who spent time on analyzing selected data chunks in past.

Looking at the daily charts from one year one will see that the number of recorded timewave pulses was decreasing over the last months. If this was due to the fact that monitoring systems like the timewave detector started searching continuously our environment for artificial signals from existing quantum technology systems which might have provided to a more seldom use of those systems then this could be seen as a great success.

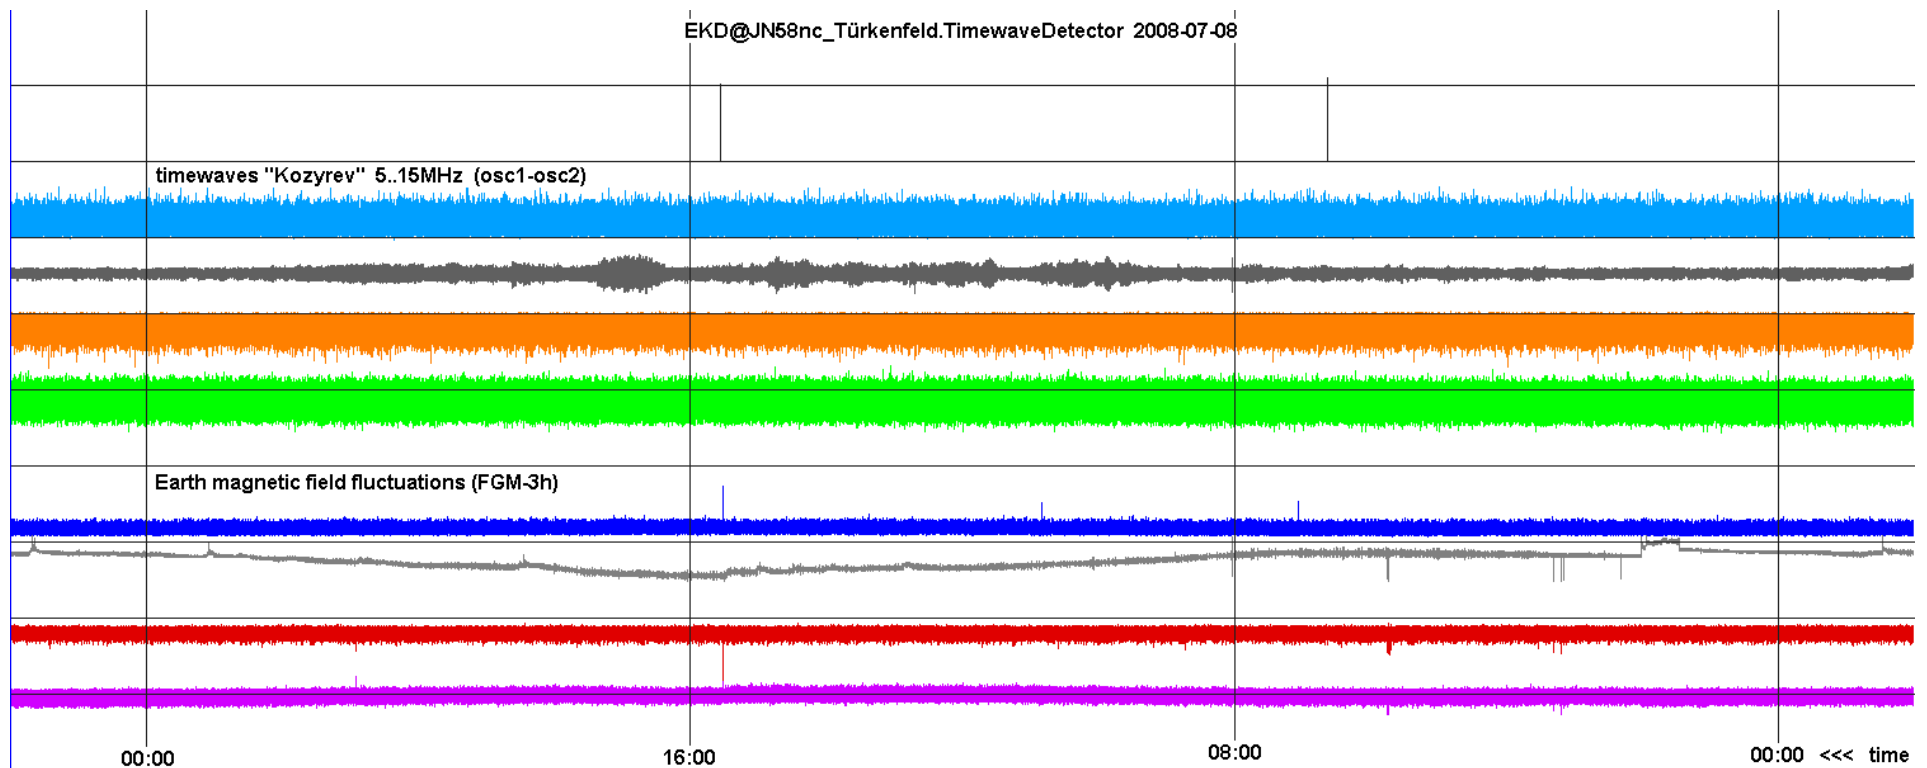

The ultimate goal is to have a global timewave monitoring system installed one day which would allow United Nations to control effectively the operation of installed quantum devices.

A series of weak pulses (~ 0.3 dB S/N) was received starting on July 24th, 2008 at 17:04:33 UTC, just when Barack Obama started his speech in Berlin.

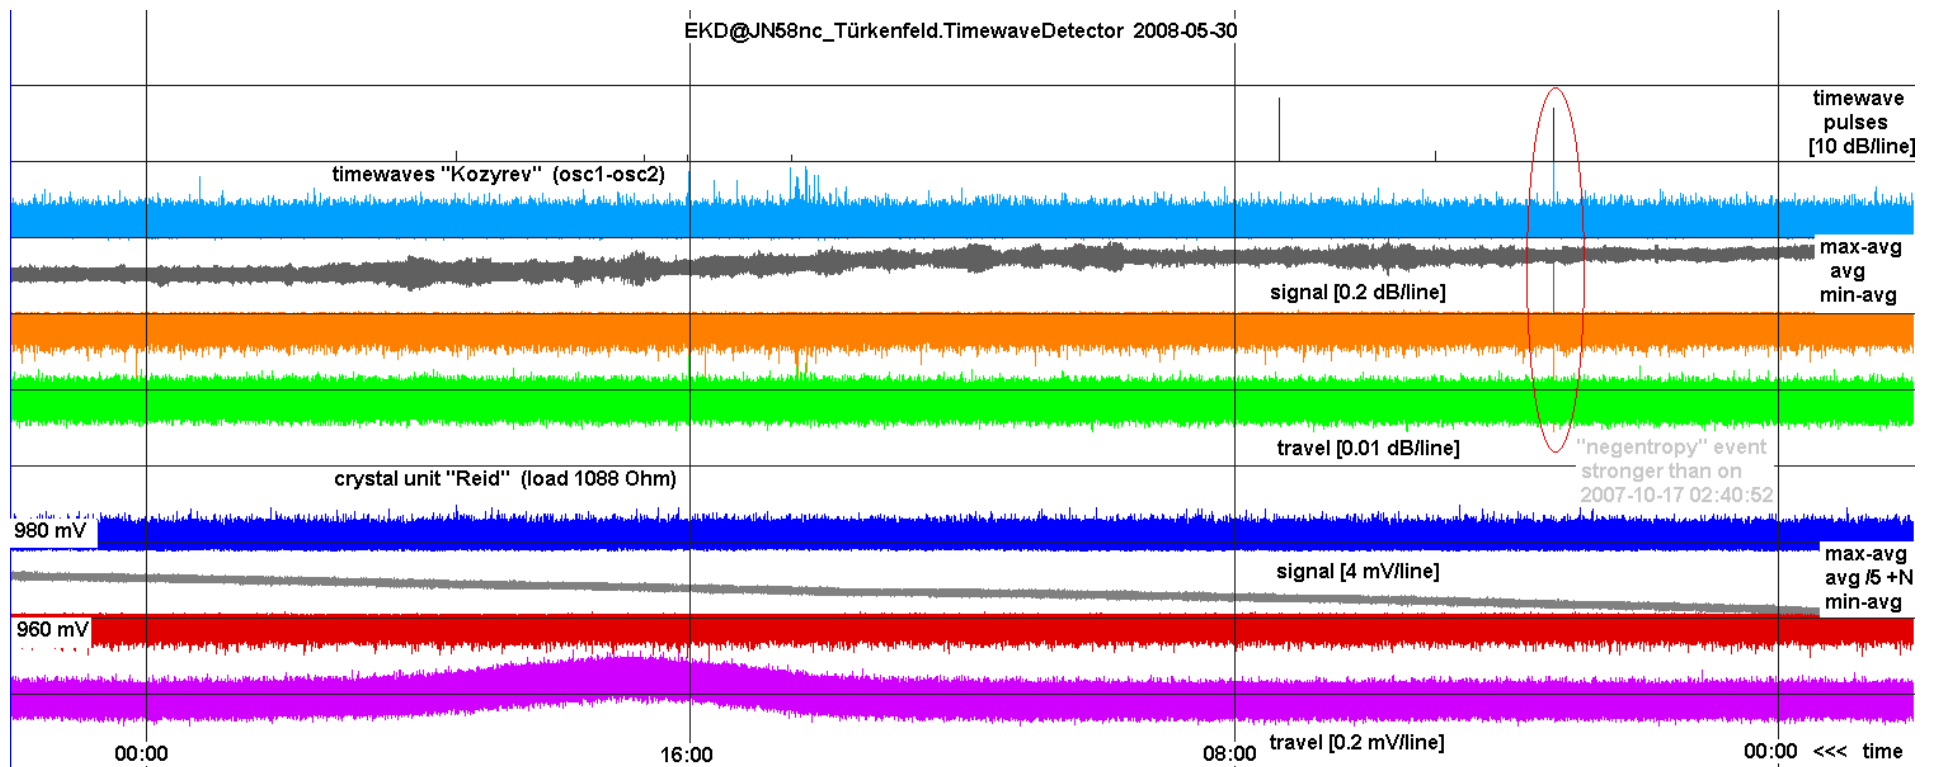

The pulses repeated every 3604 seconds with a total of 13 occurrences till the morning hour of the next day.

A similar series of pulses was received on October 9th, 2007 (9 pulses) and on May 5th, 2008 (4 pulses)

The above “modulation” in the average timewave signal (upper gray line) was increasing over time and the maximal values had correlation with sending out emails with “Terra News”, an information letter about my personal mission statement as an inhabitant on Earth:

<http://TerraBlueIT.com>

A “negentropy” event is called a signal where the strength of measured noise drops as if the temperature was lower by a couple of degrees for some hundred milliseconds. Multiple events occurred during the first year of timewave recording.
